# INTRODUCTION

- Market Basket Analysis on Sales transaction of a Pharmacy
- Gain insights into customer behavior and identify opportunities for improving sales and marketing strategies

# PROBLEM STATEMENT

The objective of this project is to understand associations and identify items frequently bought together which will help to :

- enhance customer experience
- manage inventory
- optimize marketing strategy.

Hypothesis to be tested in this project is that customers who purchase diabetic tablets are also likely to purchase multivitamins or other supplements.

# DATA DESCRIPTION

## Pharmacy Store Transactional Data

We are using raw data directly obtained from a Pharmacy Store in India.  
The dataset consists of transactional data with a row for every item sold.

### Timeframe

July 2022 to  
April 2023

### Raw Datasize

32 columns  
331k rows

### Immediate Cleaning

5 Columns  
331k rows

# Market Basket Analysis

## What?

It is a data mining technique that identifies associations and patterns in customer purchase behavior by examining the contents of their shopping baskets.

## Why?

Helps sellers identify trends which will enable stock management, or marketing.

## How?

**SUPPORT**

**CONFIDENCE**

**LIFT**

# Market Basket Analysis

## Support

It refers to the frequency or occurrence of an item or item(or item set) in the dataset.

$$\text{Support}(A) = (\text{Number of transactions containing } A) / (\text{Total number of transactions})$$

## Confidence:

Likelihood of one item or itemset occurring given the occurrence of another item or item set.

$$\text{Confidence}(A \rightarrow B) = (\text{Number of transactions containing both } A \text{ and } B) / (\text{Number of transactions containing } A)$$

## Lift:

Degree of association or dependency between two items or item sets.

$$\text{Formula: Lift}(A \rightarrow B) = (\text{Support}(A \text{ and } B)) / (\text{Support}(A) * \text{Support}(B))$$

# Market Basket Analysis

Rule : Bread  $\rightarrow$  Milk.

Support (Bread) = 0.8

Support(Milk)= 0.6

Support(Bread  $\cap$  Milk) = 0.4

Confidence(Bread  $\rightarrow$  Milk) =

(Number of transactions containing both Bread and Milk) /

(Number of transactions containing Bread)

= 2 / 4 = 0.5

Lift(Bread  $\rightarrow$  Milk) = (Support(Bread  $\cap$  Milk)) / (Support(Bread)

\* Support(Milk)) = (0.4) / (0.8 \* 0.6) = 0.83

Transaction 1	Bread	Milk	
Transaction 2	Bread	Eggs	
Transaction 3	Milk	Eggs	
Transaction 4	Bread	Milk	Eggs
Transaction 5	Bread	Juice	

# Analysis

Using the apriori function from the mlxtend (Machine Learning Extensions) library performed the following Steps :

1. Use the metrics support and confidence, to find out the frequent itemset count

USED  
SUPPORT OF  
0.001

Why?

Lower support value gave no results.

	support	itemsets
0	0.025093	(I00179)
1	0.019998	(I01815)
2	0.019236	(I01959)
3	0.022807	(I02972)
4	0.018189	(I03643)
..	...	...
123	0.001286	(I41620, I51032)
124	0.002714	(I41630, I51032)
125	0.001143	(I51032, I43570)
126	0.001381	(I47084, I47435)
127	0.001381	(I47435, I51032)

[128 rows x 2 columns]

# Analysis

2. Use metric Lift or Confidence to find out the Association Rules.

USED LIFT AS  
THE METRIC

Why?

Gives the degree of association or dependency between two items if they were independent of each other.

# Results

The Association Rules give us a list of related items.

These can be used in different scenarios by the stakeholder - for marketing, operations, stocking, etc

# PROJECT IMPLEMENTATION & IMPROVEMENT IDEAS

## **Bundle frequent itemsets**

Sell the obtained frequent item sets together

## **Market**

Market the prescription not needed items

## **Categorize**

Categorize items for cleaner results

## **Use Customer ID**

Utilizing customer ID might help us correctly identify the basket

## **Increase Frequent Itemset**

Increase the size of frequent item set

**THANK YOU!**
